Founder's Note

In 2006, I was a patient at a specialized dermatology clinic in Vienna. I had psoriasis. I was not there as an entrepreneur or an investor. I was there because nothing else had worked well enough.

What I experienced during that treatment changed how I understood both illness and recovery. The results were real. The approach was different. And the experience itself mattered as much as the medicine.

That memory stayed with me. Fifteen years later, in 2021, I started Hemp Brothers in Bratislava not as a crypto project, not as a whitepaper, but as a CBD courier service. I drove the products myself. I knew the customers by name. I built the business from the ground up, product by product, order by order, until it became what it is today: an active marketplace platform with a wide product offering and an established customer base across the EU.

Building Hemp Brothers also meant solving a logistics problem nobody else had solved in this market: guaranteed delivery under 90 minutes for e-commerce. That requirement forced us to build our own delivery infrastructure. What came out of that process became GAS, a shared city logistics network that we describe in Section 4.

HMPX is not a pivot. It is a natural extension of everything we have already built. The token exists because we hit real problems: payment processors blocking CBD transactions, loyalty systems that don't carry across platforms, and a biomedical clinic model that needs structured infrastructure to scale. Blockchain solves those problems in a way traditional systems cannot.

> **The long-term goal is to open a biomedical clinic in Bratislava built on the same model that helped me in Vienna, and to make that accessible to more people, connected to products and services we already sell every day, supported by a token that earns its relevance through actual use.**

This document explains how we intend to get there.

Karol "Carlos" Silnický
FOUNDER

02

What Hemplex Is

The business already exists: running, generating revenue, serving real customers across the EU. The token connects it.

The structure has three active layers and one planned expansion:

Hemp Brothers ACTIVE

An EU-facing marketplace platform with a wide product offering and an established customer base across the EU.

GAS PILOT

An on-demand delivery and marketplace infrastructure designed to connect local merchants with fast last-mile fulfillment.

Physical retail ACTIVE

A growing presence through branded locations and community environments.

Biomedical clinic PLANNED · PHASE 4 · NOT BEFORE 2028

A specialized dermatology and integrative wellness facility in Bratislava, built on a clinically validated treatment model.

HMPX connects these layers. It functions as a reward mechanism, a payment layer, and an access key to premium services across the network. Its value is derived from usage inside a real operating system.

They are three points on the same journey. A customer discovers a CBD product, orders it online, and gets it delivered to their door in under 90 minutes. Over time, that daily habit becomes part of how they manage their skin, their stress, their recovery. Eventually, the clinic is there for the moments when a product alone is not enough, offering the same formulations, now in a structured clinical setting, with a professional behind them. HMPX follows that person the whole way: as cashback on the first order, as a delivery incentive, as access to clinical services.

One token. One journey. Built on infrastructure that already exists.

03

The Problem We Solve

Payment Friction in the CBD Sector

Selling CBD in Europe is legal. Getting paid for it is still unnecessarily difficult. Card processors and banks regularly block transactions in this category, not because of any legal violation, but because of risk classification and institutional conservatism. This creates a practical ceiling on growth that has nothing to do with customer demand.

HMPX removes that ceiling. Token-based payments bypass the gatekeepers and give customers a frictionless way to transact across all Hemp Brothers channels.

Fragmented Loyalty

Most loyalty programs are siloed. A customer who shops across multiple platforms earns points they can't move, spending rewards that expire unused. The result is that retention tools work less well than they should, not because customers aren't engaged, but because the infrastructure underneath them is fragmented.

HMPX creates a single portable reward layer. Cashback earned on Hemp Brothers can be used across GAS delivery, future retail locations, and eventually clinical services. The value follows the customer.

Crypto Without Utility

Most tokens have no reason to exist beyond the narrative that launched them. When the narrative fades, the token fades. We have seen this pattern repeat dozens of times. HMPX is designed from the opposite direction: the business came first, the token was added because it solves a specific operational problem. That distinction is the foundation of everything else in this document.

Disconnected Wellness Care

Chronic dermatological conditions like psoriasis affect a significant and growing share of the global population. Current treatment approaches are often symptom-focused, inconsistent, and disconnected from the broader patient experience. There is a real gap between what modern integrative care can achieve, as demonstrated in clinical settings, and what most patients actually have access to.

The biomedical clinic direction of Hemplex addresses this gap directly, using a model we know works.

04

The Solution: Hemplex Infrastructure

Hemp Brothers: The Commercial Foundation

Hemp Brothers started in 2021 as an e-commerce operation with its own CBD courier delivery. Over time, the project evolved beyond a traditional e-commerce model. Instead of selling products directly, Hemp Brothers transitioned into a marketplace platform, where independent vendors can list and sell their products under one roof.

This marketplace is directly integrated with the GAS Delivery system, creating a seamless connection between commerce and logistics, enabling faster delivery, optimized city capacity usage, and a scalable foundation for future expansion.

Today, the platform represents an active and growing operation. The business is currently generating mid five-figure monthly revenue, processing several hundred orders per month across active customer accounts in Slovakia, Austria, and Hungary.

SINCE	REVENUE	MARKETS
2021	Mid 5-figure	SK · AT · HU
Founded in Bratislava	Monthly revenue	Active customer accounts

GAS: Delivery and Marketplace Infrastructure

We needed to deliver within 90 minutes. No existing service could do it reliably. So we built our own. What started as our internal logistics layer became something bigger. We kept meeting other merchants with the same problem: local shops, e-commerce operations, small businesses that needed fast city delivery but couldn't afford to build their own courier network. GAS is the answer to that. Any merchant can plug into it.

The insight behind it is simple. Cities are not short of couriers. The problem is that most of them work for one company, move one type of parcel, and sit idle for large parts of the day. GAS connects all courier types and that unused capacity into a single shared network, activating what is already there rather than adding more vehicles to already congested streets. At its core it is a system for real-time intraday capacity trading across the city. The result is faster delivery, lower operational costs, and a logistics model that scales without scaling the problem.

In practice, that means merchants get couriers within 30 minutes. Customers get their order tracked to the door, a pick-up point, or a parcel Box. Pricing is transparent. And larger operators such as DPD, GLS, SPS and Packeta can use GAS as overflow capacity when their own network is stretched.

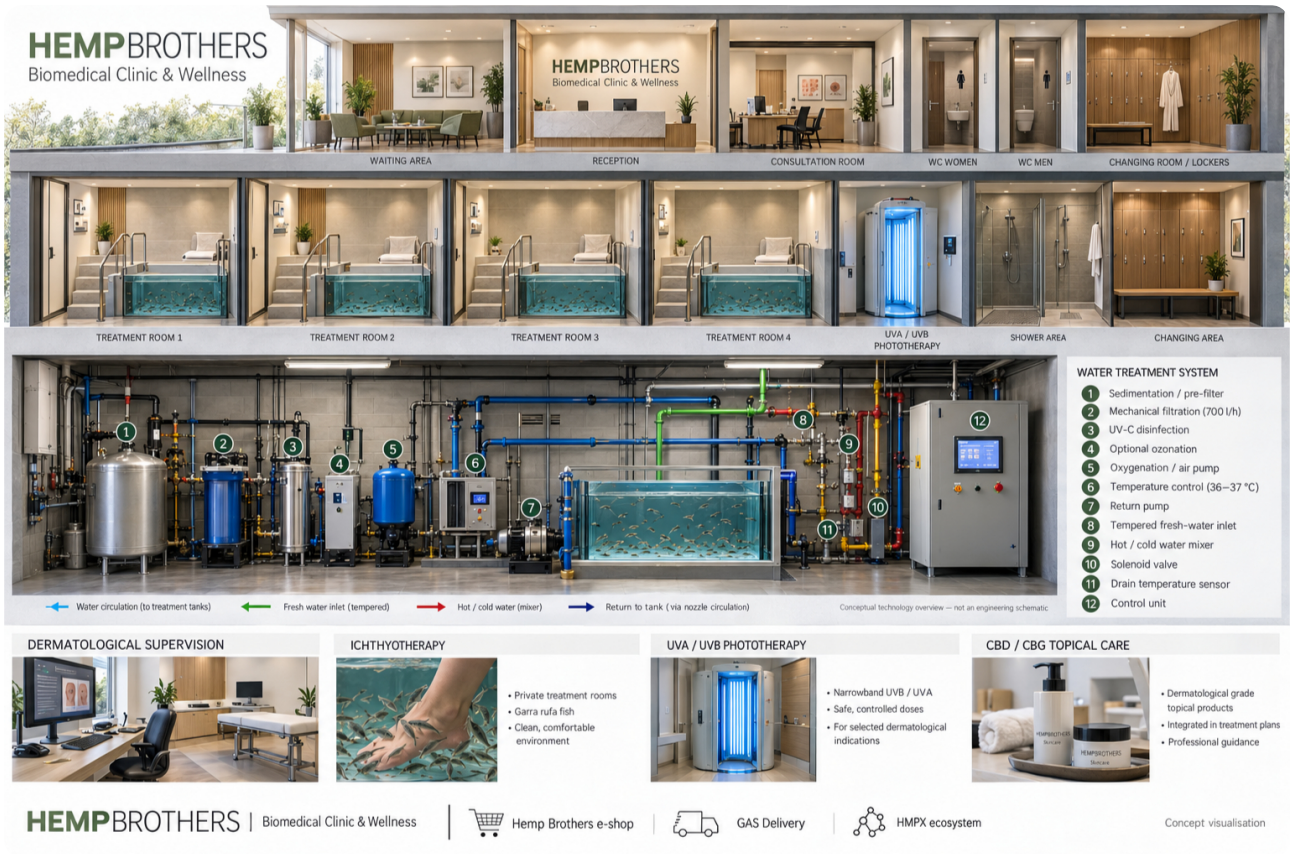

We are deliberate about how we treat couriers. They are not variables in an algorithm. They are partners. The reward structure is transparent, the system is designed for long-term relationships, and that is how we keep the network reliable.

Since spring 2026, GAS has been in a structured pilot phase in Bratislava. The pilot has been validated with first merchants under contract in the hemp and wellness vertical, the segment where we can validate the model most effectively. First deliveries have been completed within the pilot network and the demo is live. The full platform, with complete business, courier, and customer-facing applications, is targeted for Q4 2026. We are expanding the team to support the next phase of onboarding.

Once the full platform is running, HMPX integrates directly into the delivery flow: couriers earn token incentives, customers earn cashback, and every delivery becomes part of the same closed loop described in Section 8.

The long-term plan is to replicate this beyond Bratislava. The infrastructure is built for it: open merchant onboarding, B2B carrier integration, multi-format delivery. We are not trying to build another food delivery app. We are building city logistics infrastructure.

Biomedical Clinic: The Long-Term Vision

Hemp Brothers Biomedical Clinic & Wellness: concept visualisation of the planned Bratislava facility, including treatment rooms, UVA / UVB phototherapy and the water treatment system. Conceptual technology overview, not an engineering schematic.

The planned clinic in Bratislava is the most personal part of this project, and also the most grounded.

The reference model is a clinic that operated in Vienna, Austria, where I was a patient in 2006. That facility was not a concept. It was a fully operational, vertically integrated system with purpose-built treatment infrastructure, a dedicated specialist dermatologist as part of every protocol, and a documented patient outcomes record. A retrospective study involving 67 patients with moderate to severe psoriasis reported the following results:

67 patients with moderate to severe psoriasis (retrospective study)	**≈71.7%** average PASI score reduction	**>90%** of patients achieved at least PASI-50	**≈8.5 mo** average remission period

In our view, these results are in the range reported for biological treatments, achieved without systemic medication. The figures come from a single retrospective study of the Vienna clinic (reference in Section 17) and do not guarantee individual outcomes.

We are building on this validated operational foundation. The Bratislava clinic will integrate the same core protocol (ichthyotherapy, controlled UV exposure, and specialist dermatological oversight), expanded with CBD and CBG-based formulations and hemp-derived topical treatments already sold through Hemp Brothers e-commerce. The products a patient uses at home are the same formulations available in the clinic. One continuum of care, not two separate systems.

The pilot phase is planned with a core team supported by external clinical specialists. The goal is to build a complementary layer that improves patient outcomes, supports long-term adherence, and connects structured clinical care with the products and infrastructure we have already built.

> ! All clinical and biomedical initiatives are exploratory and subject to regulatory approval, clinical validation, and applicable EU healthcare compliance standards.

05

Why Blockchain and Why Solana

We did not choose blockchain first. We ran into walls, and then looked for tools that could break through them.

The conventional route, fiat payments plus a standard loyalty programme, has already been tested in this business. It produced payment rails that block and points that expire. The problems described in Section 3 translate into three concrete requirements:

REQUIREMENT 01

Payments that can't be switched off

A payment rail that cannot be reversed by a bank's risk team or a platform's policy change.

REQUIREMENT 02

Rewards that travel

One portable reward layer that moves with the customer across purchases, delivery and every other part of the business.

REQUIREMENT 03

An access layer for the clinic

A reward and access layer that persists across years and connects daily product use to clinical care, not a points balance that expires.

Blockchain meets all three. Not because blockchain is interesting, but because in each of these cases it solves a specific, concrete problem that traditional systems could not.

HMPX is built on the standard SPL Token program on Solana. The reason is practical: the token needs to work across a high volume of everyday transactions (purchases, deliveries, reward distributions). For that to be usable, it has to be fast, cheap, and compatible with every major DEX and platform in the Solana ecosystem. Solana delivers all three. The SPL Token standard is the native token infrastructure of Solana: battle-tested and universally supported by Raydium, Jupiter, Meteora, and all major wallets.

Vesting, reward distribution, and cashback logic are managed through dedicated on-chain programs including Streamflow and Squads multi-sig. Every allocation in this project is locked or streamed on-chain and verifiable by any party at any time. That is not a marketing claim. It is how the contracts are structured.

06

Token Utility

HMPX utility expands in phases, directly tied to infrastructure readiness. We do not introduce features that cannot yet be supported.

PHASE 1 · Q2 2026 · TOKEN LAUNCHED 1 MAY 2026

Cashback and Loyalty

The token enters circulation as a cashback and reward mechanism across Hemp Brothers. Customers earn HMPX on purchases and can redeem it across the platform. This creates the initial user relationship with the token through familiar commercial behavior.

PHASE 2 · Q3-Q4 2026

Payments and GAS Integration

HMPX expands into direct payments within the Hemplex structure and integrates with the GAS delivery platform. At this point, the token moves from reward mechanism to active medium of exchange.

Payments roadmap: from BTC and SOL payments on the Hemp Brothers store to HMPX fully integrated into the e-commerce platform, with HMPX cashback across shop, GAS system and clinic.

PHASE 3 · Q2-Q4 2027

Retail Expansion and Merchant Growth

Token utility expands into direct payments at physical retail locations, broader merchant onboarding across the GAS network, and GAS Van integration for larger item delivery. HMPX functions as a payment and reward mechanism across an expanded merchant base. No clinical services are introduced in this phase.

PHASE 4 · NOT BEFORE 2028

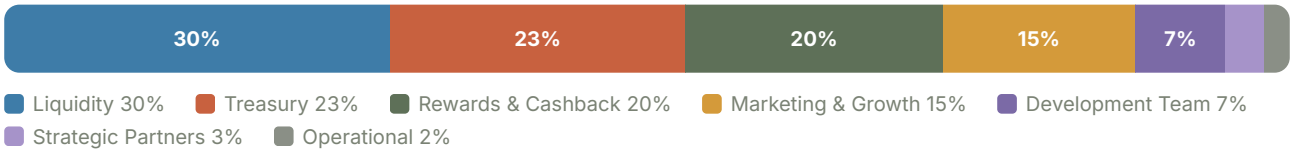

Biomedical Integration

Subject to regulatory approval and infrastructure readiness, HMPX integrates with clinical service access, treatment protocol tracking, and patient retention incentives within the Bratislava biomedical facility. This is the first phase where any wellness or clinical utility is introduced.

07

Tokenomics

Total supply: 1,000,000,000 HMPX. Fixed, no additional minting possible. Token Generation Event (TGE): 1 May 2026. All cliffs and vesting periods below are counted from TGE.

Token Allocation & Flow

Every allocation, where it is held, how it is released and where it goes. Squads multi-sig wallets require 3 of 5 signatures.

ALLOCATION	CUSTODY	RELEASE	DESTINATION
30% **Liquidity** 300,000,000	30M seed pool on Raydium. 270M in 3 Streamflow time-locks of 90M each	Seed at TGE, LP tokens burned. Each 90M tranche only when its time window has elapsed AND its milestone is confirmed	Treasury Liquidity Support (Squads), then Raydium pool after multi-sig approval
23% **Treasury** 230,000,000	Strategic reserve split into three sub-allocations with distinct custody models:		
Liquidity Support 5% 50,000,000	Squads multi-sig	Available immediately for stabilization in the initial trading window and early growth phase	Raydium pool. Any remaining balance added permanently at the clinic integration milestone
Platform & Infrastructure Reserve 8% 80,000,000	40M Squads multi-sig (emergency buffer). 40M Streamflow linear stream	Buffer: immediately accessible. Stream: after an initial lock period, ≈1,111,111 per month over 36 months	Stabilization if needed; dedicated development wallet (GAS, POS, platform integrations)
Strategic Expansion & Clinic Infrastructure 10% 100,000,000	Streamflow linear stream	12-month cliff, then 36 months in quarterly tranches of 8,333,333	Strategic Expansion sub-account (Squads)

20% **Rewards & Cashback** 200,000,000	→	Streamflow linear stream	→	2,000,000 per month over ≈100 months (≈8.3 years) → HMPX Rewards Pool sub-account (Squads), then customers
15% **Marketing & Growth** 150,000,000	→	Streamflow vesting	→	6-month cliff, then 48 months in quarterly releases tied to deployment milestones → Performance-based user acquisition
7% **Development Team** 70,000,000	→	Streamflow vesting	→	12-month cliff, then 36-month linear vesting → Team members
3% **Strategic Partners** 30,000,000	→	Streamflow vesting	→	12-month cliff, then 36-month linear vesting, under performance conditions → Strategic partners
2% **Operational Wallet** 20,000,000	→	Squads multi-sig	→	No vesting, immediately accessible → Verified operational expenses

Liquidity Deployment

Liquidity is deployed in structured phases rather than in full at TGE, so that it grows in step with real operational progress, not ahead of it. The seed pool of 30,000,000 HMPX (10% of the liquidity allocation) was established on Day 1 and its LP tokens were permanently burned via Raydium Burn & Earn, irreversibly locking that liquidity in the pool. The remaining 270,000,000 HMPX is held in three independent Streamflow time-lock contracts. Each tranche is released only when both its time window has elapsed and its project milestone has been confirmed. Released tokens arrive in the Treasury Liquidity Support sub-account and are added to the pool only with multi-signature approval.

PHASE 1 · TGE · 1 MAY 2026

30,000,000 HMPX seed pool on Raydium

LP tokens permanently burned on launch day.

PHASE 2 · INITIAL GROWTH MILESTONE

90,000,000 HMPX · Streamflow Contract 1

Milestone: defined volume thresholds and holder milestones, with verified on-chain activity.

PHASE 3 · GAS FULL DEPLOYMENT MILESTONE

90,000,000 HMPX · Streamflow Contract 2

Milestone: confirmed full deployment of the GAS platform, including operational business, courier, and customer-facing applications across the Bratislava network.

PHASE 4 · BRATISLAVA CLINIC INTEGRATION MILESTONE

90,000,000 HMPX · Streamflow Contract 3

Milestone: confirmed Bratislava clinic integration. At the same time, any remaining balance of the 50,000,000 HMPX Liquidity Support is permanently added to the pool, bringing total liquidity to 35% of supply.

Rewards Stream

The Rewards & Cashback allocation flows through three layers: Streamflow lock → HMPX Rewards Pool sub-account (Squads) → customer. The monthly cap of 2,000,000 HMPX is enforced on-chain by the stream rate. It is not a policy, but a technical constraint verifiable by any party. Changing the rate would require a new Streamflow contract and is subject to the annual governance review (Section 10). At the current rate, the pool supports approximately 8 years of distribution without replenishment. Customers may redeem accumulated HMPX as a discount on future purchases, exchange it for goods, or request a direct transfer to their wallet.

Fees and Trading Costs

HMPX has no token-level transfer tax. The token runs on the standard SPL Token program, which has no transfer fee mechanism, so wallet-to-wallet transfers carry only the regular Solana network fee, paid in SOL to the network validators and not to the project.

Trading on Raydium carries the swap fee of the HMPX pool. That fee was set when the pool was created and cannot be changed by the project or any other party. The share of trading fees that accrues to the burned liquidity is collectible only through the Raydium Fee Key NFT held in the Squads multi-sig (Section 9) and is claimed into the Treasury Liquidity Support sub-account, where it supports liquidity stabilization.

08

Token Flow and Economic Model

Every transaction in the Hemplex network feeds back into itself. A customer buys something, earns HMPX, and uses it again: on the next order, on a delivery, eventually on clinic services. The token doesn't leave the system. It circulates. That is the point.

How HMPX Circulates: The Three Flows

C

CUSTOMER

Places an order on Hemp Brothers marketplace or via GAS → earns HMPX cashback automatically → redeems on next purchase, delivery, or future clinic access.

R

COURIER

Completes a delivery through the GAS network → earns HMPX performance incentive per delivery (bonus system) → holds or spends across Hemp Brothers, GAS, and future clinic services.

M

MERCHANT

Lists products on the Hemp Brothers marketplace or GAS → pays platform fees in HMPX for a transparent discount → drives organic token demand while lowering operating cost.

The loop closes itself. No actor needs to "believe in the token". They earn it or save with it as a direct result of doing what they already do.

Incoming Payments: The Merchant Wallet

When a customer pays in HMPX at a Hemp Brothers physical location or through the online store, the payment goes to a dedicated Merchant Wallet: a Solana wallet separate from Treasury, Rewards, and Operational allocations. This keeps commercial revenue clearly distinguishable from token allocations and fully traceable on-chain. From the Merchant Wallet, received HMPX is routed to three destinations:

Operational Wallet

Day-to-day business expenses, supplier payments, and platform operations.

Treasury

Growth initiatives, liquidity stabilization, and long-term strategic expansion. Merchant HMPX replenishes only the multi-sig held sub-allocations (Liquidity Support and the Platform & Infrastructure Reserve emergency buffer). The Streamflow-locked portions are never replenished from merchant payments.

HMPX Rewards Pool

Keeps the cashback loop active. Merchant HMPX tops up the Rewards Pool sub-account alongside the monthly Streamflow stream (Section 7). From this sub-account, cashback is paid to customers based on verified purchase activity, independently of the main Treasury and Liquidity allocations. Its address and its inflows are publicly verifiable on-chain.

09

Security and Trust

These are not claims. Each one is verifiable on-chain by anyone who wants to check. We structured it this way deliberately. A system that requires you to trust us has already failed.

- ✓ **Mint authority revoked:** no additional HMPX can ever be created.
- ✓ **Freeze authority revoked:** no central party can freeze user tokens.
- ✓ **Liquidity permanently burned:** LP tokens burned via Raydium Burn & Earn on launch day. Liquidity cannot be withdrawn by any party.
- ✓ **Fee Key NFT custody:** the Raydium Fee Key NFT, issued at the time of liquidity burn, is held in the project's Squads multi-sig. Accrued trading fees are collectible exclusively via this NFT and are periodically claimed into the Treasury Liquidity Support sub-account.
- ✓ **No transfer tax:** standard SPL token, no transfer fee mechanism.
- ✓ **All allocations publicly verifiable on-chain.**
- ✓ **Independent smart contract audits planned as the project scales.**

Treasury operations are managed under a 3-of-5 multi-signature wallet structure, requiring multiple independent approvals for any significant deployment.

10

Governance

INITIAL PHASE

Multi-signature treasury controls with core team decision-making. In the early stage, fast and disciplined execution matters more than decentralized process. We need to build infrastructure, not manage consensus on every operational decision.

FUTURE PHASE

As the structure matures and operational stability increases, governance mechanisms will expand toward broader community participation. The transition will happen when the structure is ready for it.

Key token parameters, such as the Rewards stream rate, are reviewed once a year in an annual governance review. Any change that touches a Streamflow contract requires a new on-chain contract and is therefore publicly visible.

11

Roadmap

Q2 2026 · DONE

Token launch (TGE 1 May 2026)

Token launch on Raydium, liquidity provisioning, initial cashback integration with Hemp Brothers.

Q3-Q4 2026

GAS-HMPX integration

Payment systems and POS infrastructure.

Q4 2026

GAS full platform launch

Complete business, courier, and customer-facing applications.

Q2-Q4 2027

Retail expansion and GAS Van

Broader merchant onboarding and GAS Van launch (on-demand delivery for larger items and bulk orders).

2028 (NOT BEFORE)

Biomedical and dermatology clinic pilot in Bratislava

Subject to regulatory approval. Bridges daily use of Hemp Brothers CBD and CBG products with structured clinical care for physical recovery, skin health, and mental well-being. HMPX accepted for clinic services.

2029

International expansion

Based on proven execution.

12

Competitive Position

Market Timing

Hemp Brothers was built at exactly the right moment, and in exactly the wrong place. CBD was already legal across most EU member states when Slovakia remained the last country in the bloc to prohibit it. On May 1st, 2021, that changed. We launched the same year, in the same market, from day one. Not because it was easy. Because we knew the demand was already there.

What gives Hemplex a structural advantage

The business is already generating revenue. It has been profitable through organic growth, with no paid acquisition treadmill and no VC-funded growth metrics. The customer base is real and it spans the EU.

The founder's connection to this field goes back to 2006, first as a patient and, since 2021, as an operator. Twenty years of skin in the game, a business that already works, and a delivery infrastructure now being piloted with real merchants in Bratislava. That combination is not something you can replicate by writing a whitepaper. And the clinical direction is built on a treatment model that has already produced documented patient outcomes, not a concept we invented to make the story more interesting.

13

Risk Factors

We will not pretend this project has no risks. It does.

REGULATORY ENVIRONMENT

Conditions may evolve differently across EU jurisdictions, particularly in areas touching blockchain, CBD, and healthcare.

MARKET VOLATILITY

Token behavior can be affected by broader market conditions even when the underlying business performs well.

ADOPTION SPEED

Infrastructure readiness and customer understanding may affect the pace of token integration.

BIOMEDICAL TIMELINE

Clinical expansion depends on regulatory approval and infrastructure investment that cannot be accelerated arbitrarily.

14

Use of Funds

Every allocation is tied to something specific. Physical expansion follows execution, not the other way around.

- **Liquidity provisioning and market stabilization:** phased liquidity deployment as described in Section 7.
- **Platform and infrastructure development:** the GAS courier, merchant, and customer-facing applications, POS systems, and mobile payment integration. A defined technical scope with a Q4 2026 target we are already working toward.
- **Marketing and user acquisition:** performance-based and tied to acquisition milestones, not speculative spend.
- **Regulatory and legal compliance across EU markets:** a space that touches blockchain, CBD, and healthcare across multiple jurisdictions. We treat it as infrastructure.
- **Physical location expansion and future clinical infrastructure:** retail locations first, clinic infrastructure later.

15

Legal and Disclaimer

HMPX is a utility token designed for use within the Hemplex ecosystem. It does not represent ownership, equity, or any form of financial security. It is not intended as an investment instrument and should not be acquired with the expectation of financial return. Participation in blockchain-based systems involves inherent risks, including market volatility and regulatory uncertainty. This document does not constitute financial advice, investment solicitation, or an offer to sell securities in any jurisdiction.

The project operates with awareness of applicable EU regulatory frameworks, including MiCA. All wellness and biomedical initiatives are exploratory and subject to regulatory approval, clinical validation, and applicable healthcare compliance standards. Clinical figures cited in this document refer to a single retrospective study and are not a promise of individual treatment results.

16

Team

Karol "Carlos" Silnický

FOUNDER & SYSTEM ARCHITECT

Built Hemp Brothers from a one-person delivery operation into a multi-channel EU business. Background in e-commerce operations, last-mile logistics, brand development, and Web3 integration.

Denis Matejčík

FULL-STACK DEVELOPER

Core web platforms, APIs, and system architecture across the Hemplex infrastructure.

Adam Molnár

FRONTEND DEVELOPER (UI/UX)

User interface design, customer experience, and product usability.

Blockchain Developer

SOLANA

Token architecture, smart contract logic, and on-chain integrations.

Backend & Infrastructure Engineer

INFRASTRUCTURE

Server architecture, performance, and scalability.

The team operates lean and moves fast. That is intentional. We are building infrastructure, not managing committees.

Advisors and Extended Contributors

We are building relationships with external advisors across EU regulatory and legal compliance, dermatology and integrative healthcare, Web3 exchange integrations, and international market expansion. These will be working relationships with defined scope, announced as they are formalized. Beyond the core team, the project draws on a wider group of extended contributors: logistics operators, clinical specialists, and merchant partners already active within the pilot network. Execution is distributed; the core team coordinates it.
